

**Who Moved Where and Why?
Current Population Survey,
Annual Social and Economic Supplement:
California, March 2001-2003**

ACKNOWLEDGMENTS

This report was prepared by **Tadese Alemu**. **Cynthia Singer** and **Douglas Kuczynski** made significant contributions and suggestions. **Julie Hoang** coordinated and directed the report. **Mary Heim**, Chief, Demographic Research Unit, provided overall guidance.

The report has also greatly benefited from the thoughtful review, helpful comments and suggestions provided by **Dr. Hans Johnson**, Research Fellow, Public Policy Institute of California.

SUGGESTED CITATION

California. Department of Finance. “Who Moved Where and Why?” *Current Population Survey, Annual Social and Economic Supplement: California, March 2001-2003*. Sacramento, California. November 2004.

Introduction

Over five million Californians move from one place to another in an average year. As a group, these movers represent a powerful social and economic force, influencing conditions not only in the places they left but also in those where they moved. Most of them moved for family-related reasons (change in marital status, to establish their own household, etc.); to take advantage of education, employment and housing opportunities; or to live in environments they considered more pleasant (often for health and climate-related reasons).

This report will begin by looking at movers to and within California between March 2000 to March 2003. It will search for the distinctive characteristics that made some Californians more likely than others to move. Subsequently, it will look into the streams or patterns of relocation and will identify where people moved. Finally, it will explore in detail the reasons for their mobility, to try to find the triggers that caused them to move.

Every March, respondents to the Current Population Survey (CPS) were asked whether they lived at the same residence one year earlier. Based on data from the March 2001, 2002 and 2003 CPS, the report focuses on movers from March 2000 to March 2003. The CPS is a monthly household survey conducted by the Bureau of the Census for the Bureau of Labor Statistics. The population represented in the CPS is the civilian non-institutional population of the United States, including members of the armed forces not living on military bases or living in civilian housing on base. The CPS primarily provides monthly data on the labor force and, in addition, much detailed supplementary data designed to meet a wide variety of users' needs. The March supplement to the CPS is conducted in approximately 50,000 dwelling units annually, of which about 5,600 are in California. The California sub-samples are significantly smaller for certain groups than others (please refer to Appendix B).

The March supplement survey is the most important source for annual data on social, economic and demographic trends in California. But because the CPS is designed to produce national rather than state-level estimates, the data for states are not as reliable as the national figures. To improve the mobility estimates, data from the three years are combined, and an average is derived (for details on combined annual estimates, please visit http://www.bls.census.gov/cps/ads/2002/S&A_02.pdf). The CPS data were for 2001, 2002 and 2003 only because the weighted sample sizes for each of these years were fairly comparable (see Appendix A).

I. Who Moved?

The term “move” here refers to all changes of residence of any distance recorded from March 2000 to March 2003. During this period, an average of 5.4 million Californians (15.7 percent) age one and older moved from one place of residence to another. Among those who moved, mobility rates¹ vary by characteristics such as age, sex, race/ethnicity, marital status, educational attainment, labor force and employment status, class of worker, occupation, income level, poverty status, and housing tenure.

Age and Sex

Mobility changes over an individual’s lifetime. As Table 1 shows, 27.5 percent of Californians who moved were under age 18²; 69.2 percent were between 18 and 64; and only 3.3 percent were 65 and over. While one-sixth of the state’s total population changed their residence, 25.5 percent of adults age 18 to 34 moved during the period. Among adults, age and mobility were negatively correlated, that is, the likelihood of moving dropped as age increased. Mobility rates were highest for 20- to 24-year olds (30.4 percent), followed by those age 25 to 29 (28.2 percent) and lowest for people 65 and over (5.2 percent), as shown in Figure 1.

During the period, the extent of movement was the same for males and females. The proportion of females moving was 49.5 percent and that of males 50.5 percent (see Table 1). However, the male mobility rate, at 16 percent, was slightly higher than the female rate, at 15.3 percent (see Figure 2).

**Table 1. Mobility by Age and Sex:
California, Average of Years 2001 – 2003**

Selected Characteristics:	Movers	Percent	Total	Rate
Total	5,378,322	100.0%	34,300,885	15.7%
Age				
Under 18	1,479,281	27.5%	9,261,068	16.0%
18-34	2,223,128	41.3%	8,708,107	25.5%
35-49	1,078,684	20.1%	8,087,848	13.3%
50-64	421,502	7.8%	4,845,269	8.7%
65 and over	175,727	3.3%	3,398,593	5.2%
Sex				
Male	2,716,351	50.5%	16,957,553	16.0%
Female	2,661,971	49.5%	17,343,332	15.3%

¹ In this report, a moving rate/mobility rate refers to the percentage of the average number of persons who changed residence between March 2000 and March 2003 (the number of movers) divided by the total population under consideration.

² The CPS allocates mobility status for children from the mother if she is in the household; otherwise it allocates from the householder.

**Figure 1. Moving Rates by Age:
California, Average of Years 2001 – 2003**

**Figure 2. Moving Rates by Sex:
California, Average of Years 2001 - 2003**

Race/Ethnicity

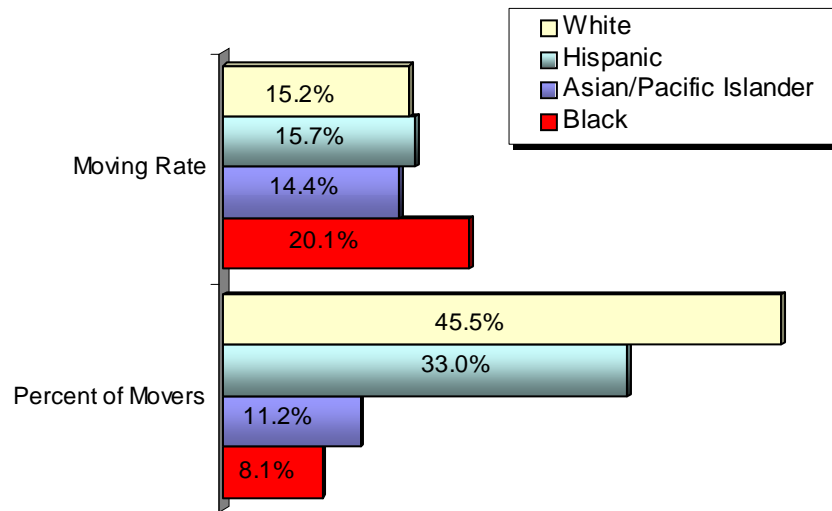

Mobility differed by race/ethnicity. Whites, with 45.5 percent, had the highest proportion of all of California movers, followed by Hispanics (33 percent) and Asians/Pacific Islanders (11.2 percent). Blacks accounted for the smallest share (8.1 percent), as shown in Table 2. In contrast, Blacks had the highest overall moving rate (20.1 percent) and Asians/Pacific Islanders the lowest (14.4 percent). Mobility rates for Hispanics were 15.7 percent and for Whites 15.2 percent (see Figure 3).

**Table 2. Mobility by Race/Ethnicity:
California, Average of Years 2001 – 2003**

Race/Ethnicity:	Movers	Percent	Total	Rate
Total*	5,378,322	100.0%	34,300,885	15.7%
White	2,449,394	45.5%	16,143,267	15.2%
Hispanic	1,775,852	33.0%	11,278,958	15.7%
Asian/Pacific Islander	602,439	11.2%	4,196,627	14.4%
Black	437,326	8.1%	2,172,190	20.1%

* Total includes all race/ethnic groups

**Figure 3. Moving Rates by Race/Ethnicity:
California, Average of Years 2001 – 2003**

Marital Status

Marital status also affected mobility. In an average year between March 2000 and 2003, 4.1 million persons age 15 years or older changed their residence—15.3 percent of all persons in that age group. As shown in Table 3, single persons had the highest proportion of movers (42.6 percent) and widowed persons the lowest (2.7 percent). Just over two-fifths (41.2 percent) of movers were married, 9.6 percent were divorced, and 3.9 percent were separated. Those who were separated were the most likely to move (24.3 percent) and widowed persons the least likely (7.4 percent). Moving rates for single persons were 20.2 percent, divorced persons 16.2 percent, and married persons 12.4 percent (see Figure 4).

**Table 3. Mobility by Marital Status for Persons (15+):
California, Average of Years 2001 – 2003**

Marital Status:	Movers	Percent	Total	Rate
Total (persons 15 years and over)	4,064,238	100.0%	26,602,500	15.3%
Never Married	1,731,631	42.6%	8,572,710	20.2%
Married	1,675,752	41.2%	13,505,043	12.4%
Divorced	391,541	9.6%	2,417,246	16.2%
Separated	157,376	3.9%	647,204	24.3%
Widowed	107,939	2.7%	1,460,296	7.4%

**Figure 4. Moving Rates by Marital Status for Persons (15+):
California, Average of Years 2001 – 2003**

Educational Attainment

Close to three million, or 13.7 percent, of all persons 25 years and over changed their residence. Table 4 shows that persons with a Bachelor’s degree or higher accounted for the highest proportion of movers (30.9 percent), followed by those with some college or an Associate degree (26.8 percent). At 19.9 percent, those with less than a high school education represented the smallest proportion of movers, followed by those with high school diploma only (22.5 percent). Differences in moving rates by educational attainment were small, ranging from 12.9 percent for persons with only high school diploma to 14.6 percent for those with a Bachelor’s degree or higher (see Figure 5).

Table 4. Mobility by Educational Attainment for Persons (25+): California, Average of Years 2001 – 2003

Educational Attainment:	Movers	Percent	Total	Rate
Total (persons 25 years and over)	2,935,640	100.0%	21,452,000	13.7%
Not a High School Graduate	583,561	19.9%	4,112,667	14.2%
High School Graduate	659,244	22.5%	5,094,333	12.9%
Some College or Associate Degree	786,859	26.8%	6,039,000	13.0%
Bachelor’s Degree or Higher	905,976	30.9%	6,205,667	14.6%

Figure 5. Moving Rates by Educational Attainment for Persons (25+): California, Average of Years 2001 – 2003

Labor Force Status

Of the estimated 25.9 million persons 16 years and older, just under four million (15.3 percent) reported moving to a new location. Persons in the civilian labor force accounted for nearly three-quarters (73.5 percent) of the movers, while persons not in the labor force accounted for 26.5 percent (see Table 5). The moving rate of persons in the civilian labor force was higher, at 16.9 percent, than that of those not in the labor force, at 12.1 percent (see Figure 6).

Among movers in the civilian labor force, nine out of ten (90.6 percent) were employed; the rest (9.4 percent) were unemployed (see Table 5). However, the unemployed were more likely to move than the employed. As shown in Figure 7, the mobility rate of the unemployed (24.4 percent) was significantly higher than that of those who were employed (16.4 percent).

The majority of employed movers were full-time workers (80.3 percent); only 15.7 percent worked part-time (see Table 5). However, the moving rate of full-time workers (16.2 percent) did not differ significantly from that of the part-timers (15.6 percent), as shown in Figure 8.

**Table 5. Mobility by Labor Force Status for Persons (16+):
California, Average of Years 2001 – 2003**

Labor Force Status:	Movers	Percent	Total	Rate
Total (persons 16 years and over)*	3,961,336	100.0%	25,958,218	15.3%
In Civilian Labor Force	2,910,791	73.5%	17,247,025	16.9%
Employed	2,638,478	90.6%	16,133,172	16.4%
Full-Time	2,119,667	80.3%	13,048,951	16.2%
Part-Time	413,614	15.7%	2,649,222	15.6%
Not Reported	105,197	4.0%	434,999	24.2%

**Figure 7. Moving Rates by Employment Status for Civilians (16+):
California, Average of Years 2001 – 2003**

**Figure 8. Moving Rates by Full-/Part-Time Employment Status for
Employed Persons (16+):
California, Average of Years 2001 – 2003**

Class of Worker and Occupation

Among employed movers, over three-quarters, 77.5 percent were employed by the private sector, 11.8 were employed by federal, state, and local governments, and 10.7 percent were self-employed or worked without pay (see Table 6). As shown in Figure 9, the moving rates of workers by class range from a low of 13.3 percent (government) to a high of 17.5 percent (private sector).

Persons in a white-collar occupation accounted for 60.8 percent of movers and blue-collar workers the remaining 39.2 percent (see Table 6). Figure 10 shows that white-collar workers were as likely to move (16 percent) as blue-collar workers (16.9 percent).

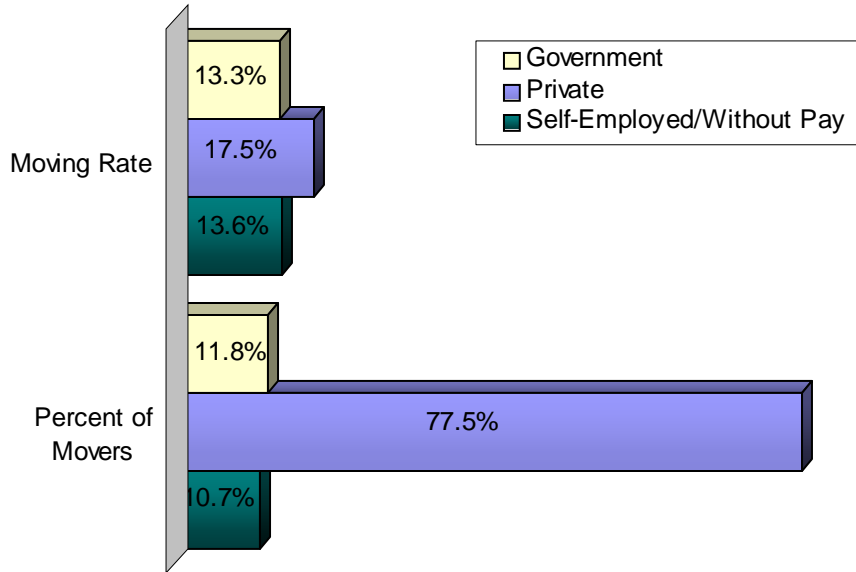

Table 6. Mobility by Class of Worker and Occupation for Persons Employed (16+): California, Average of Years 2001 – 2003

Selected Characteristics:	Movers	Percent	Total	Rate
Class of Worker (employed persons 16 years and over)				
Total	2,638,478	100.0%	16,133,172	16.4%
Government*	311,369	11.8%	2,339,764	13.3%
Private	2,044,869	77.5%	11,717,121	17.5%
Self-Employed/ Without Pay	282,240	10.7%	1,625,303	13.6%
Occupation** (employed persons 16 years and over)				
Total	2,638,478	100.0%	16,133,172	16.4%
White-Collar	1,604,290	60.8%	9,998,887	16.0%
Blue-Collar	1,034,188	39.2%	6,134,286	16.9%

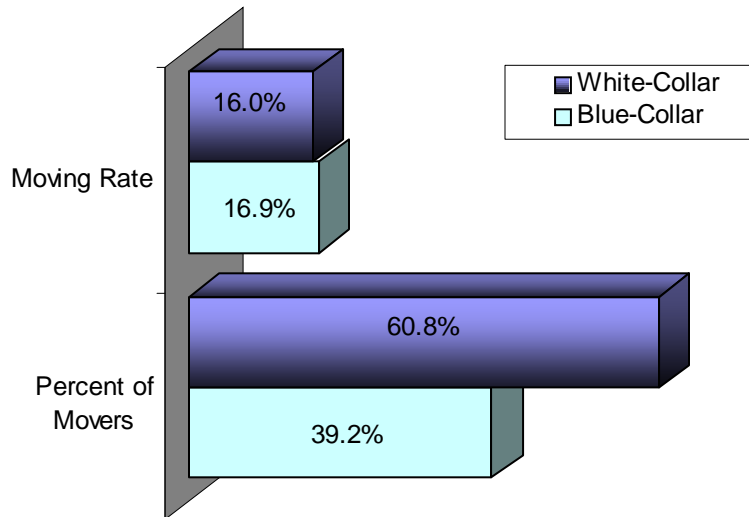

* Includes federal, state, and local government employees.

**White-collar occupations include professional; executive, administrative, and managerial; technician and related; sales; and administrative support including clerical. Blue-collar occupations include services; farming, fishing and forestry; construction and extraction; installation, maintenance, and repair; production; and transportation and material moving.

**Figure 9. Moving Rates by Class of Worker for Employed Persons (16+):
California, Average of Years 2001 – 2003**

**Figure 10. Moving Rates by Major Occupation Group for Employed Persons (16+)
California, Average of Years 2001 – 2003**

Personal Income

During the period, over half of the movers 15 years and over (52.7 percent) earned less than \$20,000 a year. About one-third (31.3 percent) had annual incomes between \$20,000 and \$49,999 and only 16.1 percent earned \$50,000 or more (see Table 7). Although moving rates varied by personal income, the differences were small. While 15.5 percent of persons with incomes under \$20,000 a year moved, only 13.2 percent earning \$50,000 or more did so (see Figure 11).

**Table 7. Mobility by Personal Income for Persons (15+):
California, Average of Years 2001 – 2003**

Personal Income:	Movers	Percent	Total	Rate
Total (persons 15 years and over)	4,064,238	100.0%	26,602,500	15.3%
Less than \$20,000	2,139,948	52.7%	13,784,448	15.5%
\$20,000 - \$49,999	1,271,848	31.3%	7,885,664	16.1%
\$50,000 or more	652,444	16.1%	4,932,388	13.2%

**Figure 11. Moving Rates by Personal Income for Persons (15+):
California, Average of Years 2001 – 2003**

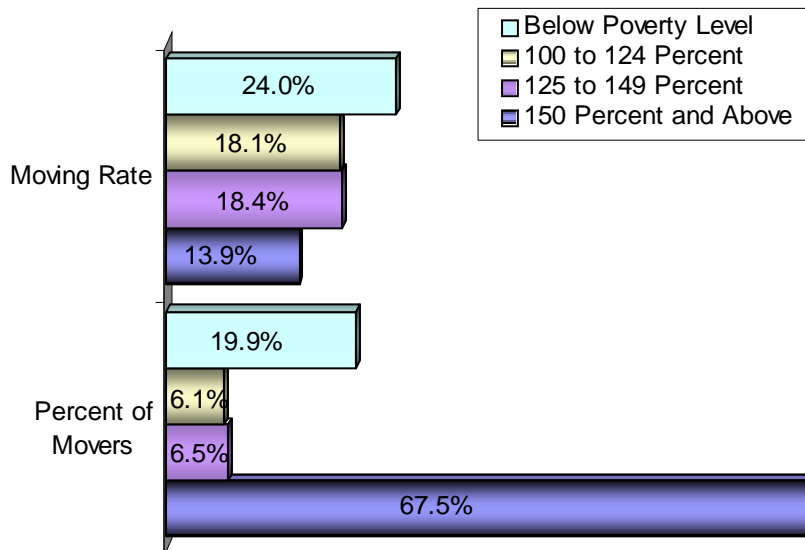

Poverty Status

As Table 8 shows, 67.5 percent of the 5.4 million people who moved between March 2000 and March 2003 had incomes 150 percent above the poverty level. The next largest proportion of movers, 19.9 percent, were below the poverty level. Those between 100 to 150 percent above the poverty level accounted for 12.6 percent of movers. People living below poverty were more likely to move than those living at or above poverty; 24 percent of persons below poverty moved, compared with only 13.9 percent of those living at 150 percent above it (see Figure 12).

**Table 8. Mobility by Poverty Status:
California, Average of Years 2001 – 2003**

Poverty Status:	Movers	Percent	Total	Rate
Total	5,378,322	100.0%	34,300,885	15.7%
Below Poverty Level	1,069,213	19.9%	4,448,109	24.0%
100 to 124 Percent of the Poverty Level	326,840	6.1%	1,807,378	18.1%
125 to 149 Percent of the Poverty Level	351,152	6.5%	1,912,185	18.4%
150 Percent and Above the Poverty Level	3,631,117	67.5%	26,133,213	13.9%

**Figure 12. Moving Rates by Poverty Status:
California, Average of Years 2001 – 2003**

Housing Tenure

Differences in living arrangements may account for some of the variation in mobility. Of the estimated 5.4 million movers, 65.7 percent were living in renter-occupied housing units and 34.3 percent in owner-occupied units (see Table 9). The renters were by far the most mobile group. They were almost three times (25.8 percent) as likely to move as owners (9 percent), as shown in Figure 13.

**Table 9. Mobility by Housing Tenure:
California, Average of Years 2001 – 2003**

Housing Tenure:	Number	Percent	Total	Rate
Total (persons in occupied housing units)	5,378,322	100.0%	34,300,885	15.7%
Owners	1,842,826	34.3%	20,579,906	9.0%
Renters	3,535,496	65.7%	13,720,979	25.8%

**Figure 13. Moving Rates by Housing Tenure:
California, Average of Years 2001 – 2003**

II. Where Did They Move?

Depending on movers' previous place of residence³, the current population survey (CPS) identified four areas of geographic mobility: within the same county (same state), different county (same state), different state, and different country (abroad). Of the 5.4 million people who moved between March 2000 and March 2003, 63.6 percent moved within the same county in California, 21 percent moved to a different county in California, 10 percent moved from a different state to California, and 5.4 percent moved from abroad to California (see Figure 14). In other words, most movers (84.6 percent) stayed within the state.

**Figure 14. Distribution of Movers by Type of Move:
California, Average of Years 2001 – 2003**

³ Residence one year prior to the March supplement survey

Age and Sex

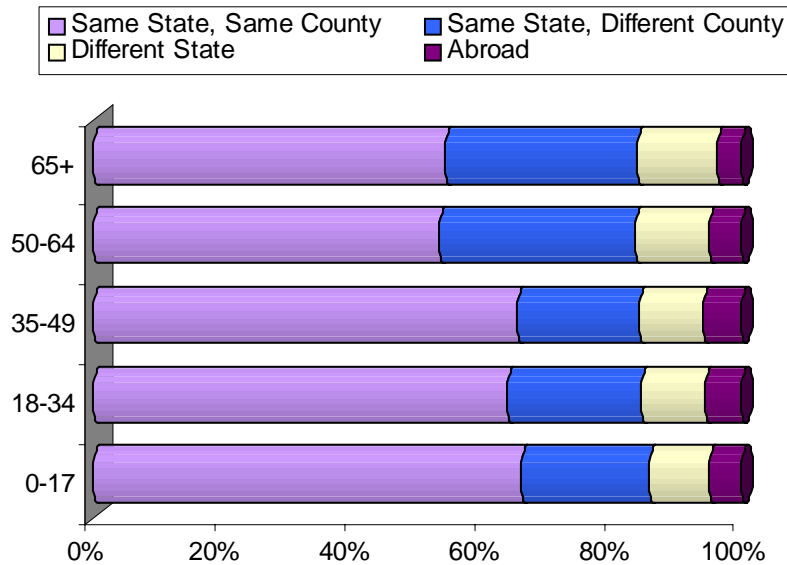

The pattern of mobility was very similar between age groups. Table 10 shows the distribution of movers by age and type of move. For each age group, more than half of the movers settled within the same county. The next highest movers were those moving to a different county in the same state, and the smallest group was those moving from abroad (see Figure 15). In each type of move, at least four out of ten movers were between 18 to 34 years old.

As shown in Table 10 and Figure 16, gender differences in the type of move were small. Of male movers, 63.2 percent moved within the same county, 20.7 percent to a different county, 10.2 percent from a different state, and 5.9 percent from abroad. Of female movers, 64 percent moved within the same county, 21.3 percent to a different county, 9.7 percent from a different state, and 5 percent from abroad. Females moved in slightly higher proportions than males within and between counties. Males moved in slightly higher proportions from different states and abroad—suggesting that males were more likely than females to move long distances.

**Table 10. Mobility by Age, Sex, and Type of Move:

California, Average of Years 2001 – 2003**

**Figure 16. Distribution of Movers by Sex and Type of Move:
California, Average of Years 2001 – 2003**

Race/Ethnicity

Among racial/ethnic groups, Asians/Pacific Islanders (9.4 percent) and Hispanics (8.5 percent) were much more likely to have moved from abroad than Blacks (3.1 percent) and Whites (2.8 Percent). Among people who moved, Hispanics (66.4 percent) and Blacks (65.8 percent) had the highest proportions of movers within the same county; Whites had the highest proportion of interstate moves. One in every seven White movers (13.5 percent) moved from other states, but only one in 18 Hispanic movers (5.6 percent) came from other states (see Table 11 and Figure 17).

**Table 11. Mobility by Race/Ethnicity and Type of Move:

* Total includes all race/ethnic groups

**Figure 17. Distribution of Movers by Race/Ethnicity and Type of Move:
California, Average of Years 2001 – 2003**

Marital Status

As shown in Table 12, it is difficult to discern patterns of differences in the streams of mobility among marital groups. Movers who were separated were more likely than others to have stayed in the same county (68.5 percent), whereas the widowed were the least likely (58.6 percent). Married persons had the highest proportion of movers from abroad (6.5 percent) and the widowed had the highest from a different state (15.6 percent). Divorced persons had much lower proportion of movers from abroad (2.2 percent), but the highest from a different county (23.6 percent).

Figure 18. Distribution of Movers by Marital Status and Type of Move: California, Average of Years 2001 – 2003

Educational Attainment

It is expected that persons with the access to better jobs and education tend to move further away. As shown in Table 13 and Figure 19, the proportions of staying in the same county were highest for movers who did not graduate from high school (65.5 percent), and the proportion of moves from different states were highest for movers with a Bachelor's degree or higher (12.4 percent). The proportion moving from abroad was lowest among movers with some college or an Associate degree (2.2 percent) and highest among those who did not graduate from high school (10 percent).

Figure 19. Distribution of Movers by Educational Attainment and Type of Move: California, Average of Years 2001 – 2003

Labor Force Status

Table 14 shows the pattern of relocation by labor force and employment status. Movers who were in the civilian labor force were more likely to stay in the same county (64.5 percent), but those not in the labor force were more likely to move to a different county (23.3 percent), from a different state (10.8 percent), and from abroad (7.2 percent).

As shown in Table 14 and Figure 21, movers who were employed had much higher proportions of moving within the same county (65.6 percent) than the unemployed (54.2 percent). In contrast, the unemployed had much higher proportions of moves from abroad (14.9 percent) than the employed (4.1 percent).

In addition, movers with full-time jobs had a slightly higher proportion of moving within the same county, and those with part-time jobs had higher proportions between counties and from different states (see Figure 22).

Class of Worker and Occupation

Table 15 and Figure 23 show that government employees had the highest proportions of moves within the same county (71 percent), compared with 65.9 percent of private employees and 57.3 percent of self-employed/employed without pay. In contrast, private-sector employees had the highest proportions from different counties (21.4 percent), compared with 19.8 percent for government employees and 19.1 percent for self-employed/employed without pay. Those self-employed/employed without pay had remarkably higher proportion of movers from abroad (13.9 percent) than government (1.2 percent) and private employees (3.1 percent).

The differences in the types of mobility by occupation were small. However, white-collar workers who moved were slightly more likely to have moved within the same county (66.2 percent), to a different county (21.2 percent), and from a different state (9.9 percent), whereas blue-collar workers were more likely to have moved from abroad (6.2 percent), as shown in Table 15 and Figure 24.

Figure 24. Distribution of Movers by Occupation and Type of Move: California, Average of Years 2001 – 2003

Personal Income

As shown in Table 16 and Figure 25, lower-income movers were much more likely to have moved from abroad than those with middle or higher incomes: 8.4 percent for incomes under \$20,000, compared with 2.8 percent for incomes between \$20,000 to \$49,999, and 2.6 percent for incomes of \$50,000 and over. In contrast, higher-income movers were slightly more likely to have moved to a different county (22.9 percent) than those with middle or lower incomes. Within the same county, the highest proportion of movers was recorded for persons with middle incomes (67.1 percent).

Figure 25. Distribution of Movers by Personal Income and Type of Move: California, Average of Years 2001 – 2003

Poverty Status

Movers below the poverty line were somewhat less likely than those living at or above it to have moved within the same county (59.1 percent) but more likely to have moved from abroad (12.4 percent). Movers living at or slightly over the poverty level had the highest likelihood of staying within the same county (72.9 percent) and the least likely to have moved from abroad (2 percent), as shown in Table 17 and Figure 26.

**Figure 26. Distribution of Movers by Poverty Status and Type of Move:
California, Average of Years 2001 – 2003**

Housing Tenure

Among movers, about the same percentage of owners and renters moved within the same county: 63.8 percent of owners and 63.5 percent of renters. Renters showed higher proportions than owners in moving from a different state (10.9 percent compared with 8.1 percent) and from abroad (6.8 percent compared with 2.9 percent), whereas owners had higher proportions than renters of moves to a different county (25.2 percent compared with 18.8 percent), as shown in Table 18 and Figure 27.

III. Why Did They Move?

Since 1998, a question on reasons for moving was added to the CPS to measure individuals' perceived reasons for moving. Reasons-for-moving responses⁴ were collected from the householder and for all persons one year of age and older who moved during the past year. Those who moved with the householder, however, were assigned the householder's reasons.

Of the estimated 5.4 million people who moved between March 2000 and March 2003, over half (52.5 percent) moved for housing-related reasons, about a quarter (24.6 percent) for family-related reasons, and 16.5 percent for employment-related reasons. Comparing the distribution of reasons for moving by distance of moves, however, shows that those who moved from a different state or from abroad did so primarily for employment reasons and those who moved within the state did so mainly for housing reasons (see Table 19).

**Table 19. Reasons for Moving by Type of Move:
California, Average of Years 2001 – 2003**

Type of Move		Employment-Related	Family-Related	Housing-Related	Other	Total
Same County	Number	267,515	817,175	2,206,520	128,844	3,420,054
	Percent	7.8%	23.9%	64.5%	3.8%	100.0%

	Percent	43.1%	22.5%	19.2%	15.3%	100.0%
Abroad	Number	128,802	102,178	10,241	51,307	292,528
	Percent	44.0%	34.9%	3.5%	17.5%	100.0%
Total	Number	888,030	1,323,700	2,821,644	344,948	5,378,322
	Percent	16.5%	24.6%	52.5%	6.4%	100.0%

⁴ In 2001, 2002 and 2003, seventeen response categories were listed under four major groupings: employment, family, housing, and other reasons. For more information on the reasons-for-moving question, see U.S. Census Bureau, 2003 Current Population Survey, Annual Social and Economic (ASEC) Supplement.

Age and Sex

Among adults, the relationship between age and reasons for moving suggests that increases in age decreased the likelihood of moving for employment-related reasons. The proportion moving for employment reasons was 18.4 percent for persons 18 to 34 years of age, 18 percent for those 35 to 49, 17 percent for those 50 to 64, and 5.5 percent for those 65 and over. Movers 65 years and over had the highest proportions of moves for family-related reasons (27.6 percent). The proportions moving for housing reasons were highest for those under 18 years and lowest for those 18 to 34 (see Table 20 and Figure 28), although the reasons for persons under 18 were fully allocated from the householder.

Patterns in the reasons for moving for males resemble those for females. More than half the males and females (51.5 percent of males and 53.5 percent of females) moved for housing reasons; about a quarter (24.2 percent of males and 25 percent of females) moved for family reasons; and 14.8 percent of males and 18.2 percent of females moved for employment reasons (see Table 20 and Figure 29).

California, Average of Years 2001 – 2003**

Race/Ethnicity

The same patterns in the reasons for moving emerge by the race/ethnicity of movers. Within each racial/ethnic group, most movers cited housing reasons, followed by family, and employment reasons. The proportion of moves due to housing was 55.3 percent for Hispanics, 53.8 percent for Asians/Pacific Islanders, 52.9 percent for Blacks, and 49.7 percent for Whites. Conversely, Whites had the highest proportion of employment-related movers (17.8 percent) and Blacks the lowest (13.3 percent). The proportion of family-related movers were highest for Blacks (27 percent) and lowest for Asians/Pacific Islanders (21.1 percent), as shown in Table 21 and Figure 30.

* Total includes all race/ethnic groups

Figure 30. Reasons for Moving by Race/Ethnicity of Movers: California, Average of Years 2001 – 2003

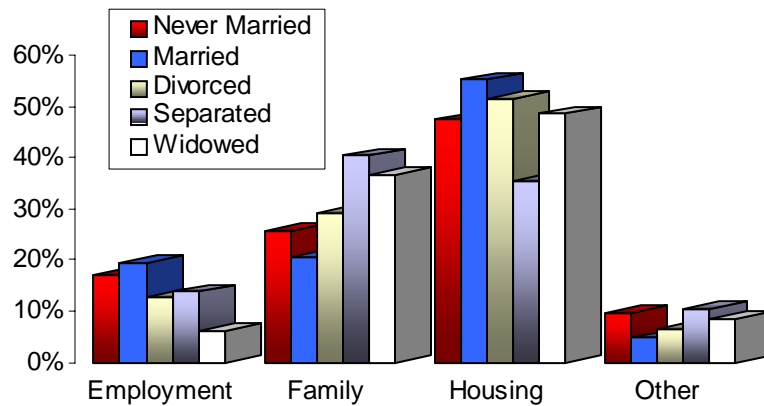

Marital Status

Housing reasons remained the most frequent responses given by most marital groups, although they were slightly less likely among separated persons (see Table 22 and Figure 31). Among movers, the likelihood of having moved for housing reasons was highest (55.3 percent) for married couples and lowest (35.4 percent) for separated persons. Similarly, married couples were the most likely to have moved for employment reasons (19.4 percent) and widowed persons the least likely (6.1 percent). The proportion moving for family reasons was highest for separated persons (40.4 percent) and lowest for married couples (20.6 percent).

Figure 31. Reasons for Moving by Marital Status of Movers: California, Average of Years 2001 – 2003

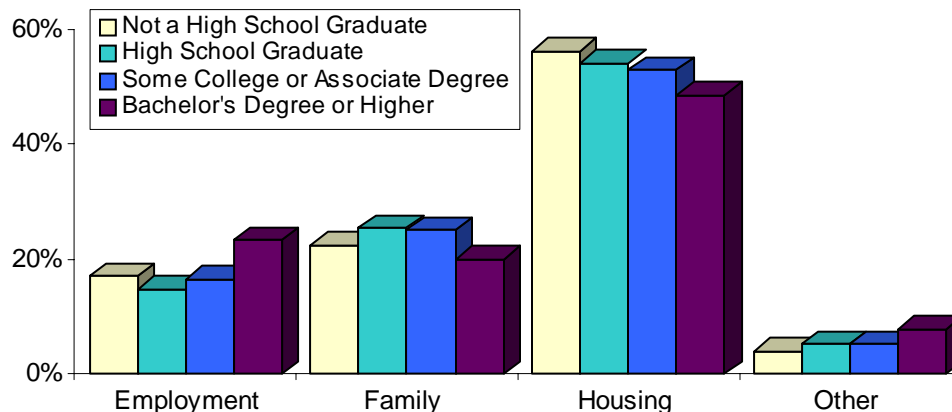

Educational Attainment

Highly educated persons were less likely to move for housing reasons but more likely to move for employment reasons. As Table 23 and Figure 32 show, 56.2 percent of movers with less than a high school education moved for housing reasons, compared with 54.2 percent of those with a high school diploma, 52.9 percent of those with some college or an Associate degree, and 48.5 percent of those with a Bachelor's degree or higher. Conversely, only 14.9 percent of movers with a high school diploma moved for employment reasons, compared with 16.6 percent of those with some college or Associate degree, and 23.3 percent of those with a Bachelor's degree or higher. Family-related movers showed no clear pattern with respect to educational attainment.

Figure 32. Reasons for Moving by Educational Attainment of Movers: California, Average of Years 2001 – 2003

Labor Force Status

As shown in Table 24 and Figure 33, the proportion of movers for family and housing reasons were about the same for those in and not in the labor force. However, the proportion moving for employment reasons was eight percentage points higher for those in than not in the labor force.

On the other hand, reasons for moving were quite different for employed and unemployed people. The proportion moving for housing reasons was 52.2 percent for the employed, compared with 36.5 percent for the unemployed; for family reasons, 24.5 percent for the employed, compared with 26 percent for the unemployed; and for employment reasons, 17.8 percent for the employed, compared with 31.6 percent for the unemployed (see Figure 34).

Among those employed full-time, 54 percent moved for housing reasons, 23.6 percent for family reasons, and 18 percent for employment reasons. The comparable statistics for those employed part-time were 48.2 percent housing, 27 percent family, and 14.7 percent employment (see Figure 35).

Class of Worker and Occupation

Table 25 shows reasons for moving by class of workers and their occupation. Regardless of their class, workers moved primarily for housing reasons, followed by family and employment reasons. While government employees had the highest proportion of people who moved for housing reasons (59.9 percent), the self-employed/employed without pay had the highest proportion of people who moved for family and employment reasons. Government employees had also the lowest proportion moving for employment reasons—13.5 percent, compared with 18 percent for private employees and 21 percent for the self-employed/employed without pay.

The proportion of movers who moved for housing reasons was 51.4 percent for blue-collar workers and 52.7 percent for white-collar workers. Over a quarter of movers who moved for family reasons were blue-collar workers (27 percent), compared with 22.9 percent of white-collar workers. Employment reasons were the least frequently given for moving (15.6 percent for blue-collar workers and 19.2 percent for white-collar workers), as shown in Figure 37.

California, Average of Years 2001 – 2003**

**Figure 37. Reasons for Moving by Movers' Occupation:
California, Average of Years 2001 – 2003**

Personal Income

The relationship between personal income and reasons for moving shows that movers with incomes of less than \$20,000 a year were more likely to move for family reasons, while movers with incomes of \$50,000 or more were more likely to move for employment reasons but less likely to move for family reasons (see Table 26 and Figure 38).

**Table 26. Mobility by Personal Income and Reasons for Moving:
California, Average of Years 2001 – 2003**

**Figure 38. Reasons for Moving by Movers' Personal Income:
California, Average of Years 2001 – 2003**

Poverty Status

Regardless of movers' poverty status, housing reasons were the most important ones for moving, followed by family, and employment reasons. However, movers living below the poverty level were more likely than those living at or above it to move for family and employment reasons. In contrast, movers living at or above the poverty level were more likely than those living below it to move for housing reasons (see Table 27 and Figure 39).

Table 27. Mobility by Poverty Status and Reasons for Moving: California, Average of Years 2001 – 2003

Figure 39. Reasons for Moving by Movers' Poverty Status: California, Average of Years 2001 – 2003

Housing Tenure

As shown in Table 28 and Figure 40, employment and family reasons were less important among owners; housing reasons were less important among renters. The proportion of those moving for housing reasons was 61.9 percent for owners and 47.6 percent for renters. The proportion moving for employment reasons was 18.9 percent for renters (compared with 12 percent for owners) and for family reasons was 26.8 percent for renters (compared with 20.4 percent for owners).

IV. Multivariate Analysis

In order to examine the direct, combined and relative effects of the demographic, social, and economic variables on the likelihood that a person moved, a logistic regression⁵ model was employed. Since variables such as marital status, education, labor-force status, employment status, class-of-worker status, and personal income relate to a certain age threshold, those under 18 years were removed from this analysis. Because of the strong linear relationship between independent variables (see Appendix C: Test of Multicollinearity⁶) and because some of the variables essentially measure the same concept (e.g. personal income and poverty status), only selected variables are included in the final model.

The results of logistic regression are most easily interpreted using the odds ratios⁷ derived from the regression-equation estimates. In general, odd ratios greater than 1 imply that people with the specified characteristic are more likely to have moved than the reference (comparison) group. Odds ratios equal to 1 mean that for these people, the likelihood of having moved is the same as the reference group. Ratios of less than 1 indicate that these people are less likely to have moved than the reference group.

Table 29. Logistic Regression Predicting the Likelihood of Moving

Variables:	Parameter Estimate	Standard Error	Odds Ratio
Intercept	-1.8088	0.00270	-----
Age			
18-34 (Reference)	-----	-----	-----
35-49	0.0146	0.00198	0.443*
50-64	-0.3309	0.00230	0.313*
65 and over	-0.5127	0.00493	0.261*

⁵ This is a regression technique useful when the observed outcome is restricted to two values that usually represent the occurrence and non-occurrence of an event (in this case movers and non-movers). With logistic regression, the dependant variable should always be a binary or dichotomous variable that assumes only two values (as movers or non-movers) rather than continuous. For more information on Logistic Regression with SAS, go to <http://www.iub.edu/~statmath/stat/all/cat/1b1.html>

⁶ The condition that two or more independent variables are strongly related (correlated) is called multicollinearity. Multicollinearity is a problem specific to multivariate analysis and can be measured in a number of ways. One way is a correlation matrix. This matrix is characterized by 1's on the diagonal and is symmetric, which means the information below the diagonal is identical to that above it. To examine the correlation between any two independent variables, one can look at the matrix in the cells either above or below the diagonal. The bottom number in each cell indicates whether significant multicollinearity between variables exists. A value less than or equal to 0.05 suggests significant multicollinearity. The top value in each cell is the correlation coefficient (r-value). It measures the relationship between the variables and ranges between -1 and 1. Generally, if the absolute value of the top number is 0.6 or more, the variables are strongly inter-related and should not be used. For details in multicollinearity, please refer to Ronald P. Cody and Jeffery K. Smith. 1997. *Applied Statistics and the SAS Programming Language*, 4th edition.

⁷ This is the ratio of the probability of occurrence (movers) of an event over the probability of non-occurrence of that event (non-movers).

----- Not applicable

The model considers mobility status as the dependent variable and age, sex, race/ethnicity, marital status, educational attainment, class of worker, poverty status, and housing tenure as independent variables.

If the effect of age on the likelihood of moving is examined, people age 35 to 49 were less than half as likely as the 18- to 34-year olds to have moved, while people age 50 to 64 were about one-third as likely as the 18- to 34-year olds to have moved. Those over 65 were about a quarter as likely as the 18- to 34-year olds to have moved. Consistent with the finding in the univariate section, women were as likely as men to have moved.

All non-Hispanic racial/ethnic groups were more likely than Hispanic or Latinos to have moved. Blacks were the most likely to have moved, followed by Whites and Asian/Pacific Islanders. While divorced and separated persons were more likely to have moved than those who were married, single and widowed persons were as likely as those who were married to have moved. Separated persons were almost twice as likely as those who were married to have moved.

Educational attainment had a positive effect on the likelihood of moving. The chances of moving increased with higher educational attainment. Government employees were as likely as private-sector employees to have moved, while the self-employed/employed without pay were less likely to move than comparable private-sector employees.

People at or above the poverty level were less likely to have moved than those below it. Those with incomes 150 percent above the poverty level were least likely to have moved. Furthermore, people living in renter-occupied housing were almost three times more likely than those living in owner-occupied housing to have moved. Overall, housing tenure explained much of the variation in moving rates.
